1. Now that you’ve practiced refining your prompts, share one example of how your output changed. Post both your original prompt and the improved version, then reflect on what made the difference. Did you add more context, set a role, or change the structure? How did those adjustments affect the response?

1 / 1 point

Original: Help me create plan to learn AI.

Refined: Act as an expert AI curriculum designer and senior machine learning engineer. I want to learn Artificial Intelligence, and I need a highly structured, step-by-step learning roadmap tailored to my specific goals and technical background.

Here is my context:

1. Current Technical Background: "I am a computer science student with strong Python skills and experience in data structures, parallel computing (MPI), and basic data libraries like Pandas and Scikit-learn, but I am new to deep learning."
2. Ultimate Goal: "I want to transition into an ML Engineer role, specifically focusing on building and fine-tuning Large Language Models (LLMs) and deploying them to production."
3. Time Commitment: "I can dedicate 10 hours a week for the next 6 months."

Please provide a personalized learning plan broken down by month or week. For each phase, include:

- Core Concepts & Theory: The specific mathematical or algorithmic topics to master.
- Practical Skills & Tools: The frameworks, libraries, or tools to learn (e.g., PyTorch, Hugging Face, Docker).
- Hands-On Projects: Concrete, portfolio-ready project ideas that match that phase's skill level.
- High-Quality Resources: Specific course recommendations, documentation links, or textbooks.

Ensure the plan focuses heavily on bridging the gap between theory and practical engineering, minimizing "tutorial hell."

Reflection:

By giving the AI a clear role, background context, a specific task, and a time constraint, the improved prompt produced a much more useful response - one that emphasized hands-on projects over purely theoretical coursework.

2. By comparing before-and-after examples, you'll see how small choices in wording and design can shift the model's behavior. What techniques or strategies did you learn for your own prompting practice?

1 / 1 point

Good prompting is really about being specific and clear, not just asking a question. The key tricks are: give the AI a role to play, tell it your background and what you want, say exactly how you want the answer formatted, and tell it what to avoid. The more specific you are, the more specific the answer will be. For important tasks, do it in two steps: first share your context and let the AI clarify its assumptions, then ask for the full answer. The simple rule is: if your prompt is vague, the answer will be vague too.
